

Intro to GitHub

ProvisionHacks 2021
Justin Liu

What is GitHub?

- Github is a provider of Internet hosting for software development and version control using Git
- It also provides access control and several collaboration features
 - Basic task management tools for every project
 - Websites through GitHub Pages
 - Create new versions of software without compromising current versions

Why do we use GitHub?

- Enables developers and programmers to collaboratively work on code -- no matter where they are in the world
- Even the big tech companies like FANG use GitHub today
 - It's important to know your way around GitHub as a programmer
 - Can serve as a portfolio -- showcase your projects/past experience

What is Git?

git

- GitHub runs on Git
 - Analogous to how an iPhone is powered by iOS
- Git is a command line tool, GitHub provides a Web-based graphical interface
- Git is a version-control/history system created by computer mastermind Linus Torvald

```
$ git init
Initialized empty Git repository in /tmp/tmp.IMBYSY7R8Y/.git/
$ cat > README << 'EOF'
> Git is a distributed revision control system.
> EOF
$ git add README
$ git commit
[master (root-commit) e4dcc69] You can edit locally and push
to any remote.
 1 file changed, 1 insertion(+)
 create mode 100644 README
$ git remote add origin git@github.com:cdown/thats.git
$ git push -u origin master
```

GitHub Desktop

- GitHub Desktop is an application that enables you to interact with GitHub using a GUI instead of the command line or a web browser
- A GUI allows users to interact with a program using a visual interface rather than relying on text commands
- Later on, people migrate over to using the terminal and find that to be more productive

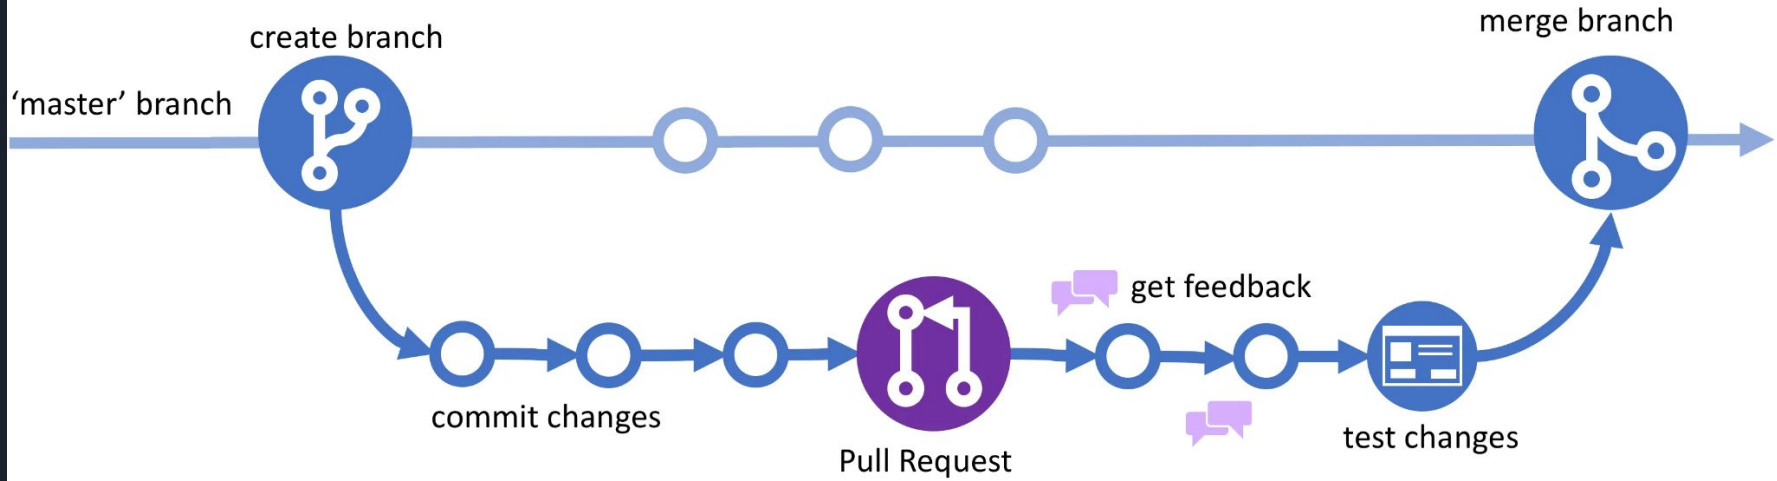

GitHub and IDE's

- GitHub is even built-in to some IDE's now!

GitHub Flow

How To Navigate GitHub

- If you want to take a look at my GitHub page for reference:
<https://github.com/SourLemon23>
- Overview tab
 - Pinned projects
 - Contributions/activity
 - Connections/followings
 - Contact info, personal information
- Repositories tab - all their public repos
- Projects
- Packages

Your Turn!

- 1) Make a GitHub account
- 2) Create a repo
- 3) Create a branch
- 4) Create & commit changes to your branch
- 5) Open a pull request
- 6) Merge your pull request

1) Make a GitHub account

<https://github.com/>

2) Creating your first repo (project)

-
- To do anything in GitHub, you'll need to know how to first start a repository
 - A repository stores everything pertinent to a specific project including files, images, spreadsheets, and data sets
 - To create a new repository, you'll hit the + sign and then "new repository" in the upper-right-hand corner. You can then name your repository, include a brief description, and check the box that says "initialize this repository with a README." Finally, you'll click "create repository."
 - You may also choose to include a license or .gitignore file

Topics

- Similar to tags or hashtags that are attributed with your project

About READMEs

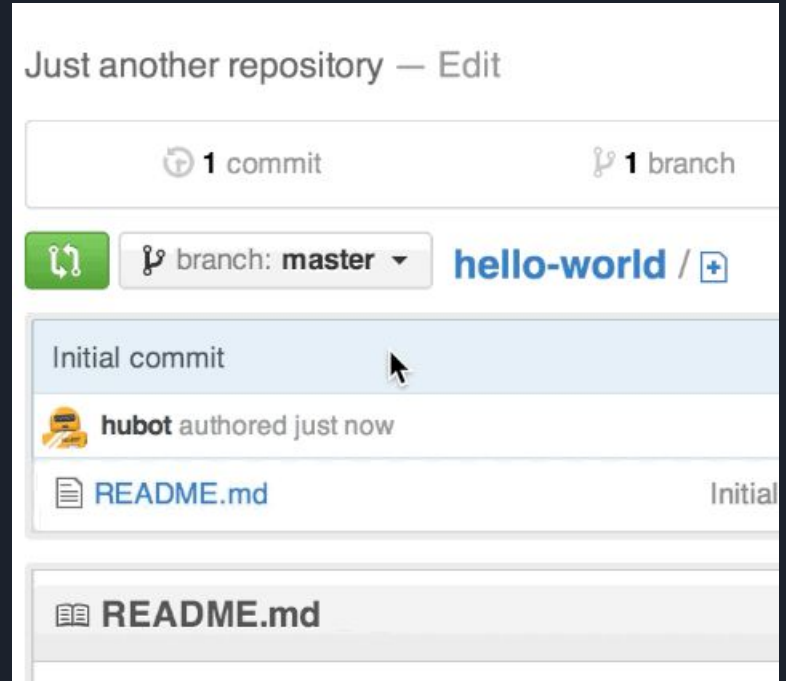

- You can add a README file to your repository to tell other people why your project is useful, what they can do with your project, and how they can use it
- People will normally skim your README before looking at anything else -- it's like a summary/ToB
- A template:
 - What the project does
 - Why the project is useful
 - How users can get started with the project
 - Where users can get help with your project
 - Who maintains and contributes to the project
- You can add images, links, and a lot more in a README
- Uses the markdown language - .md

About branches

-
- Projects are multi-faceted and many program versions are required when you're building
 - Branching enables you to edit multiple unique versions of a repository at once -- they allow experimentation
 - By creating a branch, you're making a snapshot/copy of the main branch
 - Every repository automatically has a "master branch" -- the default/main branch
-

To create a new branch:

- Go to your new repository.
- Click the drop down at the top of the file list that says branch: main.
- Type a branch name, readme-edits, into the new branch text box.
- Select the blue Create branch box or hit “Enter” on your keyboard.
- Now you have two branches, main and readme-edits.

About commits

On GitHub, saved changes are called commits

Each commit has an associated commit message, which is a description explaining why a particular change was made

Commit messages capture the history of your changes, so other contributors can understand what you've done and why

Make and commit changes

- Click the README.md file.
- Click the pencil icon in the upper right corner of the file view to edit.
- In the editor, write a sentence about yourself.
- Write a commit message that describes your changes.
- Click Commit changes button.

About pull requests

- Now that you have changes in a branch off of main, you can open a pull request.
- Pull Requests are the heart of collaboration on GitHub
- When you open a pull request, you're proposing your changes and requesting that someone review and pull in your contribution and merge them into their branch
- The changes, additions, and subtractions are shown in green and red
- By using GitHub's @mention system in your pull request message, you can ask for feedback from specific people or teams, whether they're down the hall or 10 time zones away.

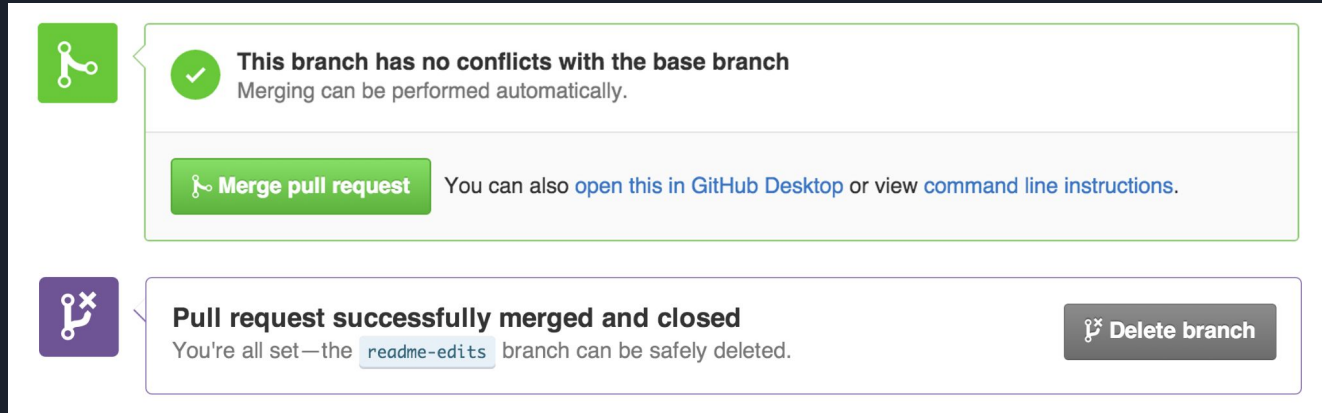

Open a pull request

- Click the Pull Request tab, then from the Pull Request page, click the green “New pull request” button.
- In the Example Comparisons box, select the branch you made, readme-edits, to compare with main (the original).
- Look over your changes in the diffs on the Compare page, make sure they’re what you want to submit.
- When you’re satisfied that these are the changes you want to submit, click the big green Create Pull Request button.
- Give your pull request a title and write a brief description of your changes.
- You can preview your new changes by switching over to the preview

The last step - merge your pull request

- It's time to bring your changes together – merging your readme-edits branch into the main branch
- Click the green Merge pull request button to merge the changes into main.
- Click Confirm merge.
- Go ahead and delete the branch, since its changes have been incorporated, with the Delete branch button in the purple box.

The screenshot displays two notification boxes from GitHub. The top box, with a green border, contains a green icon of a merge, a green checkmark, and the text: "This branch has no conflicts with the base branch" followed by "Merging can be performed automatically." Below this is a green button labeled "Merge pull request" and a line of text: "You can also [open this in GitHub Desktop](#) or view [command line instructions](#)." The bottom box, with a purple border, contains a purple icon of a branch with an 'x', the text: "Pull request successfully merged and closed" followed by "You're all set—the `readme-edits` branch can be safely deleted." To the right of this text is a grey button labeled "Delete branch".

 **This branch has no conflicts with the base branch**
Merging can be performed automatically.

 **Merge pull request** You can also [open this in GitHub Desktop](#) or view [command line instructions](#).

 **Pull request successfully merged and closed**
You're all set—the `readme-edits` branch can be safely deleted.

 **Delete branch**

Thank You!
